

Cisco Security MARS

Security for your entire network.

Today's security challenges put your organization at risk, threatening your reputation, business information and ability to comply with regulations. Cisco's Security Monitoring, Analysis, and Response System (MARS) is a high-performance appliance providing threat management, monitoring and mitigation for greater security and more effective use of network and security devices.

How Does it Work?

Through event log correlation of Cisco devices, MARS provides an end-to-end topological view of the network, learning the configuration and behavior of the environment. This allows MARS to greatly reduce false positives, make precise recommendations for threat mitigation and generate fast response to attacks and intrusions.

MARS provides additional security by automatically updating knowledge of new Cisco IPS signatures for up to the minute reporting on your environment. It also employs NetFlow and syslog to provide awareness of environmental anomalies with network behavior analysis and possesses the ability to visualize the attack path and identify the source of the threat with detailed topological graphs.

In order to help you comply with stringent regulations, MARS provides simple access to 150+ ready-to-use customizable reports, correlation with Cisco Security Manager, and event lookup and policy provisioning.

Cisco Security Monitoring, Analysis and Response System:

- Collects, analyzes, and correlates data from a diverse set of Cisco devices
- Learns the topology, configuration and behavior of your environment
- Makes precise recommendations for threat mitigation including the ability to visualize the attack path and identify the source of the threat with detailed topological graphs
- Integrates with the Cisco Security Manager to correlate security events with the configured Firewall rules and Intrusion Prevention System (IPS) signatures that can affect the security event
- Suggests mitigation for rapid threat containment
- Delivers high performance, handling up to 15,000 events per second
- Provides simple access to audit requirements with more than 150 ready-to-use customizable reports
